# Making Data Migrations Easy

Legacy ERP <u>seamlessly replaced</u> by New ERP System <u>without disruption.</u>

With today's unprecedented rate of data growth there are a myriad of challenges associated with migrating to new applications. Large numbers of ERP and platform migrations fail due to issues associated with moving the data from the old system to the new one. Organizations invest large amounts of money, time, and effort in buying and customizing a new ERP system, only to overlook the challenge of the time, cost, and risk associated with populating the new system with legacy data. Some tools are available, however, this leads to a painstakingly attempt to build an in-house data migration solution from scratch using these tools. This approach is costly, lacks safeguards, causes interruption to the business, and most importantly, these tools don't provide certain features that the old system had which were critical to the business. The other option available is to either employ a Systems Integrator with a team of highly paid consultants. Either way organizations will be struggling to efficiently, securely, or cost effectively accomplish the project.

The UNiTY platform provides a secure, seamless, and cost effective data integration and migration solution in real-time and without disruption to the business. The UNiTY platform offers a one-stop-shop user experience, making it transparent to the users which system the data is coming from and going to. Through, the data is delivered to the user and updated in the new system seamlessly, cost effectively, and without the risk of data loss or security breach. The data will be transferred from the old system(s) to new in one(s) without interruption. One of our customers migrated their legacy helpdesk ticketing system in less than two hours on a Sunday evening. The users never knew Monday morning that they were working from the new system.

The UNiTY Platform Seamlessly Populates the New ERP System   **Behind the Scenes**

The UNiTY platform is an agnostic solution that enables improved data quality, rapid deployment, and data integration from any enterprise system without interruption to the users. UNiTY significantly lowers an organization's total cost of ownership and eliminates the risk of data loss and operational interruption.
